

# Data Processing Advanced

*Seyed Mostafa Kia  
April 2024*

# Data Processing Advanced

- ❖ Prerequisites: Familiarity with Python, and Data Processing course
- ❖ We will learn about Python tools for scientific computing:

- ❖ Learning goals:
  - ❖ Write functions to analyze data using the NumPy and Pandas
  - ❖ Implement vectorized computations to efficiently process large datasets
  - ❖ Explain the advantages/disadvantages of manipulating data in Python, NumPy, and Pandas
  - ❖ Generate visualizations of data and results

# Course Structure and Routines

- ❖ Seven (1 hour 45 minutes) lectures:
  - ❖ Tuesday, April 9, 12:45 - 14:30 (SZ 31): Numpy Basics
  - ❖ Tuesday, April 16, 12:45 - 14:30 (SZ 31): Numpy Multi-Dimensional Arrays
  - ❖ Tuesday, April 23, 12:45 - 14:30 (SZ 31): Numpy Vectorized and Linear Algebra Operations
  - ❖ Tuesday, April 30, 12:45 - 14:30 (SZ 31): Pandas: Basic Topics
  - ❖ Tuesday, May 7, 12:45 - 14:30 (SZ 31): Pandas: Advanced Topics
  - ❖ Tuesday, May 14, 12:45 - 14:30 (SZ 31): Data Visualization using Matplotlib
  - ❖ Tuesday, May 21, 12:45 - 14:30 (SZ 31): Data Processing Tools in Action
- ❖ TBD: Exam training lab session
- ❖ Please regularly check the updates at <https://rooster.uvt.nl/schedule> (MyTimeTable)

# Course Structure and Routines

- ❖ This is a **research skill** course: to excel in programming, you must train rigorously in the lab.
- ❖ Practical Sessions
  - ❖ Every Wednesday, Thursday, and Friday in Cube 242
  - ❖ More information is available in Canvas.
  - ❖ Please regularly check the updates at <https://rooster.uvt.nl/schedule> (MyTimeTable)

# Course Structure and Routines

## ❖ Canvas: course materials and communications

### ❖ Modules:

#### ❖ Lecture Materials:

- ❖ Jupyter notebooks
- ❖ Course slides
- ❖ Lecture recordings

#### ❖ Post-Lecture Materials:

- ❖ Daily exercises
- ❖ Sample exam questions
- ❖ Solutions

### ❖ Discussions:

- ❖ General questions
- ❖ Anonymous discussion

The screenshot displays the Canvas LMS interface for course 880668-M-3. The left sidebar contains navigation links: Account, Dashboard, Courses, Calendar, Inbox, History, and Help. The main content area shows the course name and a list of discussion topics. Under 'Pinned Discussions', there are two topics: 'General Questions' and 'Anonymous Discussion'. Under 'Discussions', there is one topic: 'Numpy arrays (week 1) topics'. A 'Closed for Comments' section is also visible at the bottom.

# Students' Weekly Activities

# Practical Info on Coding

❖ We will use Python 3 and JupyterLab during the lectures, practical sessions and exam:

- ❖ You can use uvt JupyterLab server: <https://jupyter.uvt.nl/>
- ❖ You can install Anaconda on your local computer.

❖ You can also use other IDEs:

# Evaluation and Exam

- ❖ Evaluation: 100% final exam.
- ❖ The final exam (and resit) is an on-campus programming exam.
- ❖ The exam will be organized via TestVision.
- ❖ The questions are mostly around programming tasks, i.e., writing a Python function for a specific task.
- ❖ Students can use all course materials with **limited** access to the internet.
- ❖ We will organize a training exam session before the final exam.
- ❖ Exam dates:
  - ❖ Final exam: June 13, 2024.
  - ❖ Resit: July 11, 2024.

# Grading

- ❖ Exams will be graded automatically using a Python program.
- ❖ Each question will be worth in total 4 points:
  - ❖ 0 points for submissions with errors in any of test cases.
  - ❖ 0 points for submissions that return the incorrect object type in any of test cases.
  - ❖ 0 points for submissions that do not follow the instructions.
  - ❖ 1 point for returning the correct object type without any errors.
  - ❖ 2 points for passing some tests but not all (without error in all testcases).
  - ❖ 4 points for passing all tests.
- ❖ You need a score of 55% or higher to pass the exam.

# Questions?

# NumPy Basics: Arrays and Datatypes

# What is NumPy?

NumPy is the fundamental package for scientific computing in Python.

- ❖ NumPy provides the possibility for fast operations on multi-dimensional arrays:
  - ❖ Statistical, mathematical, and logical operations
  - ❖ Shape manipulation
  - ❖ Sorting
  - ❖ Basic linear algebra
  - ❖ Random data simulation

# What is an array?

- ❖ Multi-dimensional arrays (ndarrays) are basic data structures in NumPy.
- ❖ A NumPy array is a structured collection of elements with the same datatype.
- ❖ Arrays are defined by the number of dimensions and the number of elements along each dimension.
  - ❖ 1-dimensional array (vector): e.g., stock price
  - ❖ 2-dimensional array (matrix): e.g., a table of data
  - ❖ N-dimensional array (tensor): e.g., an RGB image

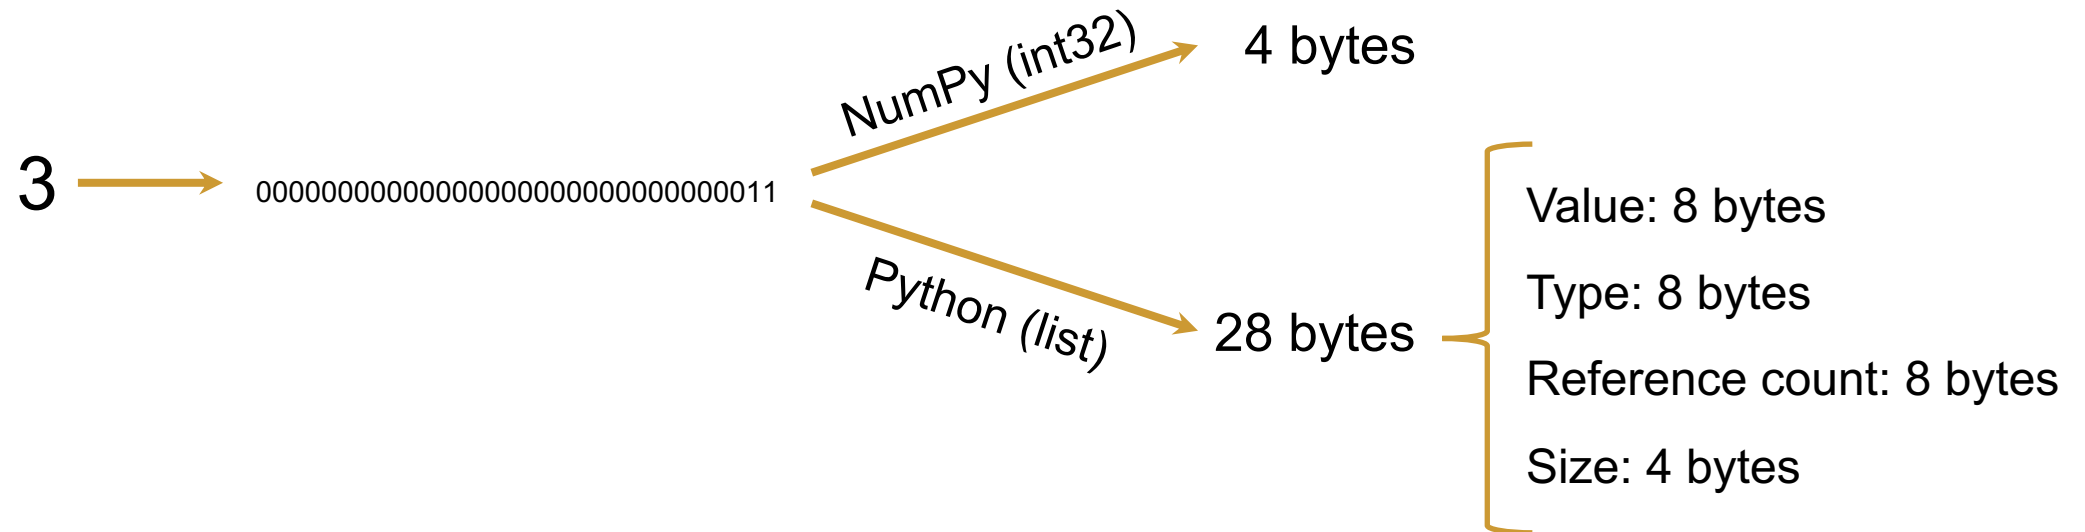

An element

# Why NumPy arrays?

Because they are very **efficient** (memory space and processing time) in numerical operations.

❖ Unlike lists in Python, NumPy uses **fixed types** for arrays.

# Why NumPy arrays?

NumPy is very **efficient** in numerical operations on large arrays.

- ❖ Unlike lists in Python, NumPy uses **contiguous memory** schemes for storing arrays in memory.

Python Lists:

NumPy Array:

# Creating NumPy Arrays

- 1) From a Python lists or tuples:
  - `numpy.array`
- 2) From a text file:
  - `numpy.loadtxt`
- 3) Using intrinsic NumPy array creation functions:
  - `numpy.arange`
  - `numpy.linspace`
  - `numpy.zeros`
  - `numpy.ones`
- 4) Using random number generation functions
  - `numpy.random.random`
  - `numpy.random.randint`
  - `numpy.random.uniform`, `numpy.random.normal`

# Questions?

# Data Types in NumPy

The 6 basic data types in Numpy arrays are:

- 1) integer (`int8`, `int16`, `int32`, or `int64`): is used to store integers between  $-2^{n-1}$  and  $2^{n-1} - 1$  where  $n$  is the number of bits.

# Data Types in NumPy

The 6 basic data types of Numpy arrays are:

- 1) integer (`int8`, `int16`, `int32`, or `int64`): is used to store integers between  $-2^{n-1}$  and  $2^{n-1} - 1$  where  $n$  is the number of bits.
- 2) unsigned integer (`uint8`, `uint16`, `uint32`, or `uint64`): is used to store non-negative integers between 0 and  $2^n - 1$ .

# Data Types in NumPy

The 6 basic data types of Numpy arrays are:

- 1) integer (`int8`, `int16`, `int32`, or `int64`): is used to store integers between  $-2^{n-1}$  and  $2^{n-1} - 1$  where  $n$  is the number of bits.
- 2) unsigned integer (`uint8`, `uint16`, `uint32`, or `uint64`): is used to store non-negative integers between 0 and  $2^n - 1$ .
- 3) float (`float16`, `float32`, or `float64`): is used to store real numbers.

# Data types in NumPy

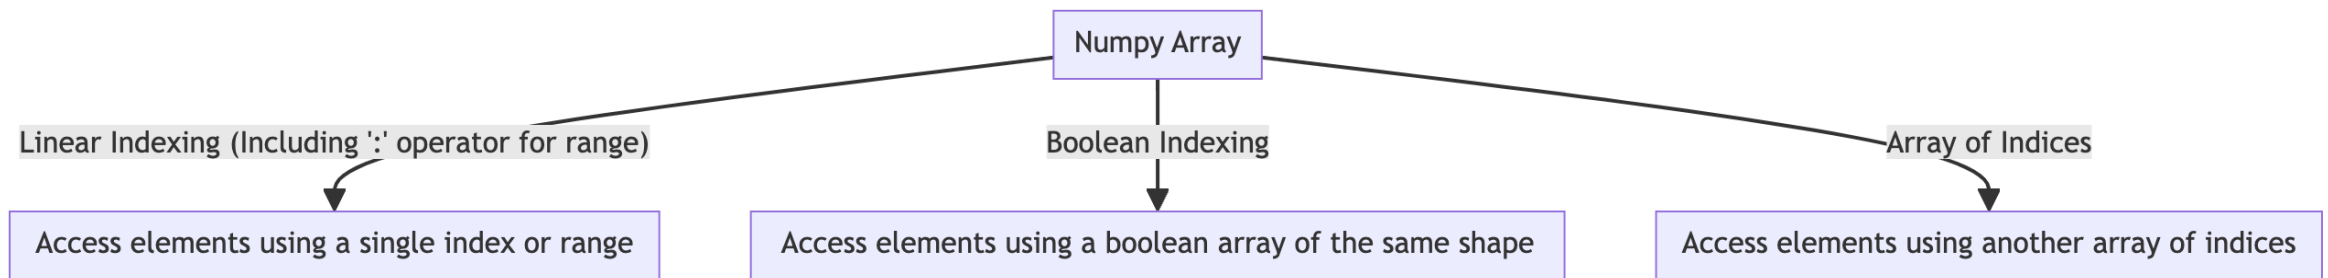

The 6 basic data types of Numpy arrays are:

- 1) integer (`int8`, `int16`, `int32`, or `int64`): is used to store integers between  $-2^{n-1}$  and  $2^{n-1} - 1$  where  $n$  is the number of bits.
- 2) unsigned integer (`uint8`, `uint16`, `uint32`, or `uint64`): is used to store non-negative integers between 0 and  $2^n - 1$ .
- 3) float (`float16`, `float32`, or `float64`): is used to store real numbers.
- 4) boolean (`bool`): True and False
- 5) complex (`complex64` or `complex128`)
- 6) String: for example `<U3` or `<U64`, where the number indicates the maximum length of the strings

# Questions?

# Indexing Arrays in NumPy

- ❖ Linear indexing
- ❖ Boolean Indexing
- ❖ Indexing with an array of indices

# Questions?

# Thanks!
